

NuAnchor

How much to buy, from which factory, and what it really costs
— **with confidence.**

Live at nuanchor.nustack.tech · five slides of product, two of positioning · demo script in the pack

WHAT IT IS

A planner does this in three tools. NuAnchor does all three.

01 · DEMAND

Reads what's selling

Looks at what is selling now and what sold last year. Gives a range, not one fake-precise number.

02 · BUY

Works out how many

Subtracts what you already have, and checks it against the budget.

03 · SOURCING

Finds the real cost

Compares factories, adds shipping and import duties, warns if too much sits in one country.

Click any number and it tells you why.

And nothing gets ordered until a person says yes.

Each step hands the next one its numbers and its reasoning. No competitor does all three.

The season buy is the year's biggest cash bet — and most of it is guesswork.

70–80% of the stock budget is committed 4–6 months before anything sells — in a spreadsheet, off a price a factory emailed them.

\$1.73T

lost every year

stockouts + overstocks, global retail

81%

still plan in spreadsheets

no working shown, nothing about factories

~2×

import duties jumped in 2025

the cost of buying abroad will not sit still

What changed: **the cost of buying abroad used to be a number you looked up. Now it moves.**

Where the money comes back.

2–5 pts

gross margin

from buying the right amount of the right things.

30%+

of inventory marked down

gets discounted today in fashion. This targets the styles causing it.

6–12%/yr

carrying cost freed

cash tied up in stock nobody needed.

And the real cost is priced before you commit

so an import-duty jump does not quietly eat the season's profit after the order is placed.

They're excellent — and they're a two-year programme.

~\$175K/yr

entry, mid-size retailer

plus \$10–30K onboarding

12–24

months before it is running

enterprise rollout, led by implementation

≥1×

the licence fee again, in year one

setup and consulting often costs as much again

Point tools — Toolio, Cogsy, trend feeds

Each does one piece well. None passes its answer to the next step, and none does import duties.

The real incumbent — Excel, email and gut

81% of companies. They built it, so they will defend it. Do not attack it.

“Nobody buys a two-year programme to decide next season. [This runs today, on your own sell-through file.](#)”

What we do that they do not.

	NuAnchor	o9 / Blue Yonder	Point tools	Spreadsheets
One flow: what is selling → how many → which factory	Yes	Partly	No	No
Import duties and factory risk built in	Yes	Partly	No	No
Shows why, for every number	Yes	Partly	No	Partly
A person approves, and it is all logged	Yes	Partly	No	No
Affordable and quick for a sub-\$2B brand	Yes	No	Yes	Yes
Gets better the more you use it	Yes	No	No	No

THE LAST ROW IS THE WHOLE ARGUMENT

Every season it is scored against what actually sold, and the fix goes back into the part that got it wrong. A competitor starting next year has no record of your seasons to learn from.

Who to pitch, and the three-minute demo.

PITCH THIS

Apparel, footwear, accessories and durable consumer brands

Sub-\$2B DTC / wholesale, sourcing overseas

Seasonal buys — the bet placed months ahead of the sale

Head of Merch · Planner · Buyer · VP Sourcing · CFO

NOT TODAY

Grocery and food — it goes off, and it is restocked constantly

Big-box and mass retail — Walmart, Lowe's. Too big, a different problem

Haggling with factories — we price and shortlist, we do not negotiate

Direct ERP connections — not yet. CSV today

FIRST THREE ACCOUNTS

Knitwell · Kohler · Jomashop

apparel group · durable goods, duty-exposed · imported high-value goods
