

How much to buy, from which factory, and what it will really cost.

It reads what is selling, works out how much to buy, prices it across factories with import duties included, and hands you a purchase order with the reasoning attached.

WHAT IT IS

A planner does this in three tools. This does all three.

01 · DEMAND

Reads what's selling

Looks at what is selling now and what sold last year, and gives you a range — not one fake-precise number.

02 · BUY

Works out how many

Subtracts what you already have and checks it against your budget, so you do not over-order or run short.

03 · SOURCING

Finds the real cost

Compares factories, adds shipping and import duties, and warns you if too much of the order sits in one country.

Click any number and it tells you why — and nothing is ordered until you say yes.

WHY IT MATTERS

The season buy is the year's biggest cash bet — and most of it is guesswork.

70–80% of the stock budget is committed 4–6 months before anything sells — in a spreadsheet, off a price a factory emailed you.

\$1.73T

lost every year
stockouts + overstocks, global retail (IHL 2025)

81%

still plan in spreadsheets
no working shown, nothing about factories (2025)

~2x

import duties jumped in 2025
the cost of buying abroad will not sit still

WHO IT'S BUILT FOR

Built for brands your size.

BUILT FOR

- **Apparel, footwear, accessories & durable** consumer brands
- **Sub-\$2B DTC / wholesale**, sourcing overseas
- **Seasonal buys** — the bet placed months ahead

Brands like Vuori · Yeti · Huckberry · Spanx · Knitwell

NOT BUILT FOR (TODAY)

- **Mass grocery & F&B retail** — e.g. FreshDirect, Kroger. The goods go off, and they are restocked constantly.
- **Big-box / mass retail** — e.g. Walmart, Lowe's. Too big — a different planning problem.
- **Supplier negotiation** — we price and shortlist; we don't negotiate.

WHAT IT CHANGES

Where the money comes back.

2–5 pts

gross margin
from buying the right amount of the right
things.

30%+

of inventory marked down
gets discounted today in fashion. Target the
styles causing it.

6–12% /yr

carrying cost freed
cash tied up in stock nobody needed.

And the real cost priced before you commit so an import-duty jump does not quietly eat the season's profit.

Ranges are industry benchmarks (IHL, BoF/McKinsey) and directional impact — not a guaranteed result.

HOW IT COMPARES

What we do that they do not.

	NUPLAY	O9 / BLUE YONDER	POINT TOOLS	SPREADSHEETS
One flow: what is selling → how many → which factory	●	◐	○	○
Import duties and factory risk built in	●	◐	○	○
Affordable and quick at your size	●	○	●	●
Shows why, for every number	●	◐	○	○
You approve, and it is all logged	●	◐	○	◐

The big suites do span all of this, but they are priced and staffed for a Fortune 500. The point tools each do one piece. This is the only one that does the whole thing at your size.

SEE IT LIVE

Run it on your own data.

LIVE RUN

File in, PO out

Drop in a sell-through file and watch the order build. Change an assumption and everything re-does itself.

THE REPLAY

One buy, end to end

One order, start to finish, with the reasoning at every step.

THE BUY DESK

A planner's day

The whole season sorted overnight — the ones needing a decision queued for you, the routine ones handled and logged.
