

Current Idea

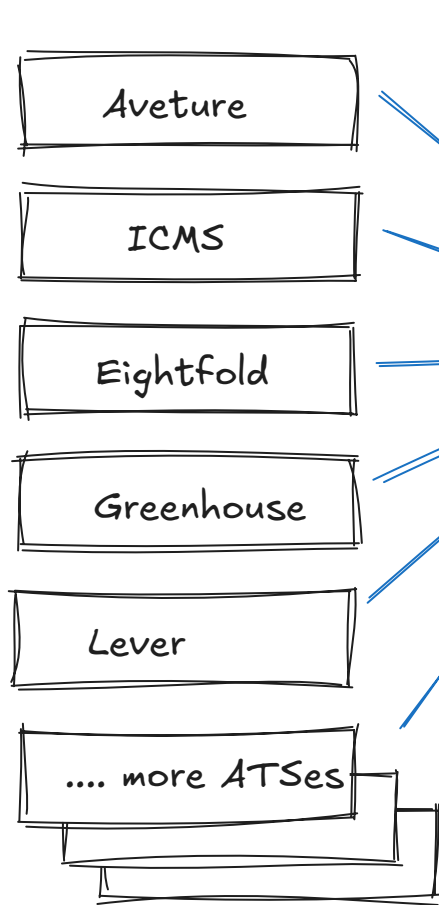

- we are trying to build AI tools like Nurix to directly integrate into Aveture to support Unifi business.
- this will work for now, as we have only one ATS and one customer

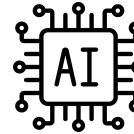

Potential Problem in the near future

- as we get more customers add more and more ATSes, this will become too complex to manage :
 - (a) building interfaces to all the ATSes for all our tools,
 - (b) training our employees to work with multiple ATSes
- this will become costly and will take more time to build individual interfaces for our AI tools and also train our employees on those ATSes

ABIL
ATS
&
candidate
platform

Ideal tech solution

- the proposal is to create a our own ATS and candidate engagement platform that will be front ending for our recruiters and all the tools that we will use to provide service to our customers and candidates
- With this model, all the complexity will be wrapped up by our new tool, and it will interface with all possible ATSes in the backend without needing users to learn the new ATSes and also needing the AI tools to work with them individually.
