

Nurix & Unifi: AI Voice Agent for Recruiting

This document outlines the governance and compliance framework that Nurix will implement for its AI Recruiting Voice Agent, developed in partnership with Unifi. The solution is designed to support compliant, and transparent use of AI in recruitment workflows, with adherence to relevant state and federal regulations applicable to vendors and developers of automated employment decision tools.

Nurix Commitments

Nurix will take the following steps to ensure compliance and risk mitigation:

1. Technical Design & Fairness

- Implement the solution as described in *Appendix A*, including the use of a transparent and auditable matching algorithm for evaluating candidate responses to subjective questions.
- The matching logic will be informed by a **phrase bank provided by Unifi**, mapped and version-controlled by Nurix.
- Document the intended outputs, use cases, and logic behind AI decisions as part of a transparent system card.

2. Risk & Compliance Governance

- Maintain and routinely update a **Risk Management Policy** governing AI system deployment, as required for developers of employment-related automated tools.
- Conduct **quarterly reviews** of AI models, processes, and risk mitigations to remain compliant with evolving state-level regulations.
- Retain all **production-level artifacts and changes** (e.g., prompt templates, scoring logic, guardrails, model versions) for a minimum of **four (4) years** from the date of creation or deployment.
- Perform and document **regular internal audits**.
- Support any **external audit** initiated by Unifi or required by applicable law.

3. Change Notification & Legal Coordination

- Notify Unifi, as required by law or contract, for instance:
 - The purpose, benefits, and intended uses of the system.
 - The intended outputs and decisions produced by the system.
 - All mitigation strategies implemented to manage foreseeable risks of bias or harm.
 - The recommended guidelines for how the system should — and should not — be used, including human-in-the-loop requirements and safeguards.

4. Public Disclosures

Nurix will publish and maintain a **public-facing statement** on its website that includes:

- A description of the AI system Nurix offers for the Recruiting Voice Agent.
- The methods used to mitigate reasonably foreseeable risks of discrimination.

This statement will be reviewed and **updated within 90 days** of any material system change.

5. Discriminatory Effects or Risk Disclosure

If a **discriminatory effect** or material risk is discovered through audits or live operations:

- Nurix will notify Unifi and any applicable State agency within **90 days**.
- The notification will include a summary of the issue, affected groups (if known), and the mitigation measures taken.

Roles & Responsibilities

- **Nurix** will be responsible for developing, updating, and maintaining the AI system in compliance with applicable vendor obligations under relevant State and Federal laws.
- **Unifi** will remain responsible for its own use of the system, human oversight processes, and any employer-side obligations required by law.

Operational Process

Nurix will follow a five-phase operational process to ensure safe, and compliant deployment of the AI Recruiting Voice Agent:

1. Design & Build

- Unifi provides phrase lists for subjective questions' evaluation.
- Nurix integrates these into matching logic, defines prompts, and prepares compliance documentation.

2. Pre-Deployment Testing

- Run simulations along with the Unifi team to validate matching logic and check for issues.
- Define fallback flows and human review conditions

3. Deployment & Monitoring

- Launch a controlled rollout with full transcript logging and real-time escalation triggers.
- Continuously monitor for anomalies and candidate experience issues.

4. Governance & Audits

- Conduct quarterly reviews and maintain 4-year change logs.
- Support internal and external audits with complete version history and documentation.

5. Communication

- Provide Unifi with regular reports and notifications.
- Maintain a public statement describing system use and safeguards, updated within 90 days of major changes.

Appendix A: Solution diagram and Call Logic

Screening and Multi-Call Logic

As part of the proposed AI-driven recruitment lifecycle, candidates may engage in **multiple structured conversations** throughout the hiring journey.

These touchpoints are designed to support screening, information capture, and reviewer enablement - without introducing AI-based judgment or bias into decision-making.

1. Screening (Deterministic, SOP-Based)

In the early stage, the AI Agent conducts structured screening based on Unifi's defined SOP rules. For instance:

- If a candidate says, "I'm TSA-cleared" or "I can work overnight shifts," these are recognized as qualifying indicators.
- If a candidate says, "I don't have a driver's license," it is tagged as a disqualifier and the conversation may be ended after communicating the reason.

As the AI Agent absorbs information and takes only boolean or deterministic decisions in this process based on an SOP - there is no risk of bias

2. Subjective Questions (Structured Answer Collection)

For open-ended prompts such as, “What would you do when you see a coworker not following safety rules?”, the algorithm:

- Collects the candidate’s complete responses during the call.
- Tags each phrase against Unifi’s approved positive / negative phrase list using a semantic matching algorithm.
- Highlights positive phrases in **green** and negative ones in **red** for easy reviewer scanning.
- Sends candidates whose responses include positive phrases straight to self-scheduling for the next interview.
- Flags candidates whose responses include negative phrases for an asynchronous human review. If they pass the review, they will be sent to self-scheduling for the next interview.

The final determination for any candidate response with negative phrases is made by a human reviewer, with the matching algorithm only serving as a support tool for enabling the review.

Subjective Question Example

Q. “You’re working at Airport and see a coworker not following a safety rule - for example, they are not wearing safety gear or are in a restricted area. What would you do?”

Positive Indicators

A. I believe in a **safety first** mindset. To ensure that there is no harm, I will follow the procedure like **alerting my supervisor**

This is something that **should be a priority** for any team member and hence it will be the first thing I ensure while **cautioning** the person in concern.

Negative Indicators

A. I think if it is someone I do not know, best would be **not poke my nose in their business**. I will **ignore it** unless it seems super important

3. Ongoing Engagement (Post-Selection Follow-Up)

Once a candidate has been selected, the system continues to support **post-offer engagement** - such as onboarding guidance, pre-joining reminders, and document checklists through follow-up calls or chat-based interactions.

These conversations are structured but personalized, helping maintain candidate clarity and retention till the start date.

They involve no decision making and will share information to the ATS in case of any updates.
